We’re getting a lot of requests for the specialist firm Simply Loft. “For those who’ve extended the ground floor and the loft, it might seem as if there’s nowhere left to go, so this is a bonus. People use them to add a bedroom, a study with a sofa bed or sometimes a bathroom.”

James Gold, director of Landmark Lofts, a London-based firm, has been receiving people’s conditioned attics as well as designing new ones for the unconverted. “People regularly call in to rebounds that more complicated the design, and replace windows with large folding glass jams that open up the door of the property.”

“People didn’t use loft conversions as master bedrooms when inferior insulation made them cold in the winter. But the kids and their friends, but this is our space now — we love it,” Lauren says. “We read the papers up here on a study area back, keeping the warmth in during winter, but prevents overheating during summer. The result is a low-energy modern new floor and a smart new bedroom.”

Upgrading an old or had loft conversion gives you the chance to bring the insulation up to current building regs and to install honeycomb-style double glazing to keep the warmth in during winter, but prevent overheating in summer weather. The result is a low-energy modern new floor and a smart new bedroom. You need a minimum 190cm height in a loft, and there are some limitations on how much you can max out the top floor by adding a “pod” — the buzzword du jour in the loft world. A classic Victorian or Edwardian terrace or semi often has a section sticking out at the back with a flat roof, known as an outrigger. On top of this, you can add a pod to create an extra room, usually about 3 metres x 3.5 metres in size; prices start at about £27,500.

Never mind a dingy office — the latest loft conversions are seriously luxe. If yours isn’t up to scratch, you can have the whole space revamped by Cherry Haslen.

The top floor has been transformed,” Lauren and Philippe Langham decided to do the same when they upgraded a loft that had been converted into a makeshift office by the previous owners. They decided to rethink the house.

With a gabled roof, a box dormer can extend the full width of the house at the back, giving you plenty of vertical space for floor-to-ceiling windows. And you don’t need planning consent for the glass and the new bedroom.

Loft ambitions
Under permitted development rights, you can extend the roof with a 2.5m cube of extra loft floor, giving your home up to 40 cubic metres for terraced homes.

Building regulations need to be followed if you want to convert a loft into livable space. They cover the strength of the floor, fire safety and insulation.
